

Building Better Slides

A manifest-driven, layout-aware deck compiler For the class of
2026

Amit — July 2026

Why this approach

Each slide is its own file. Benefits:

- ▶ **Reorderable** — rearrange the manifest list
- ▶ **Reusable** — drop a slide into another deck
- ▶ Per-slide **layouts** via frontmatter

Is this working?

Two column layout

The left region holds normal markdown:

- ▶ bullet one
- ▶ bullet two
- ▶ bullet three

The right region is independent.

A quote sits in a tinted box, not a stripe.

Big stat callout

98%

of slides rendered without manual layout tweaks

Image beside text

The image resolves relative to **this slide file**.

- ▶ positioned by the layout
- ▶ text sits alongside

Part Two: Details

Rich content works

Good slides are mostly whitespace and one clear idea.

```
def greet(name):  
    return f"Hello, {name}!"
```

Feature	Supported
Lists	Yes
Code blocks	Yes
Tables	Yes

Thank you
